

GUN FITTING

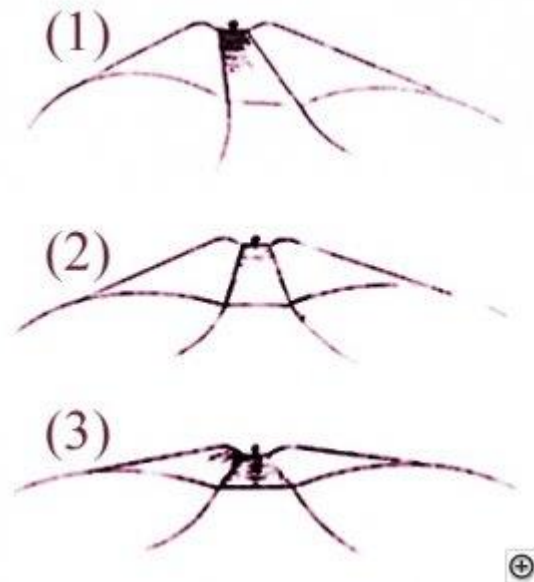

Basic Variables

While focussing on all the modern technology and as a result of this progressive prejudice we have disregarded the good old Gunfitting. Yes, one has labelled the properly fitted gun as a gadget belonging to an elite higher culture. But why? One should know that if one improves the instrument that one improves the work, in this case the shooting. Due to the figure of the shooter, the approximate and appropriate adjustment is firstly done by the gunfitter on the try gun. Then the shooter probably still has his eye not quite at the right level or direction when the stock comes comfortably to the shoulder.

- 1) View of barrels as seen by the shooter:
The shot charge will completely miss the target on the left. With a few grips the cast will be adjusted.

- 2) This already appears to be better. A few test shots on the pattern board show clearly that the shot charge lies too high. The drop is adjusted.

- 3) Does it work? Try out a few shots!

If everything seems to be correct and comfortable, a multitude of targets will be shot as confirmation. Fine tuning will be carried out. Finally the stock measures can be transmitted to a standard form. A custom made stock can be made or an existing stock can be altered – better shooting guaranteed, for the shot charge lies now where the shooter is looking!
